

Hi, guys...

It doesn't matter if it's your first or your thousandth Hackathon, everyone soon discovers the difficulty of finding a group.

It is very frustrating to expect to be chosen without people being able to really know who you are.

It was from this need that our group thought:

....what if we create the Tinder of group formation?

My name is (presenter's name) and I will introduce you (our product).

(our Product) is a multi-platform application for locating people for online group formation, cross-referencing skills information, locating people we sympathize with the summaries posted or randomly to those more daring.

We think of something that everyone will say:

"why haven't we done it before?"

A simple and straightforward algorithm, available for any and all Hackathon or a simple soccer match .

When the person registers in a Hackathon they choose which is the squad that will be part, whether UX-UI, Back, Front or Business, as well as can inform if you already have a team formed or if you want the (our Product) help in this task.

When you choose to be found by (our Product) you only need to match the presentation of other participants.

Our system distributes the skills according to the Hackathon rules, so if the rules require 4 people, our algorithm is prepared for as you enjoy the participants' presentations automatically close a team among you.

Simple, easy and straightforward. So, how about giving a match now in (our Product)?
